Subject: Investigation of an April, 2012, Bee Mortality Incidents near Manchester,

Indiana, Hypothesized to be Associated with the Planting of Insecticide-

treated Maize Seed - Report from Bayer CropScience

Dear Ms. Nesci, Mr. Moriarty, and Mr. Steeger:

In mid-April, 2012, Bayer CropScience became aware that a commercial beekeeper, Mr. David Shenefield, had observed elevated bee mortality at several of his apiary sites near Manchester, Indiana that had coincided with the spring planting of corn. Bayer's Mr. Mark O'Rouke met with Mr. Shenefield on April 20th for a preliminary tour of the area where the incidents occurred. A more thorough investigation was then conducted April 23 – 25 by Mr. O'Rouke and Mr. Dick Rogers.

The Office of the Indiana State Chemist (OISC) had also been notified of the incident on April 19th, and they had conducted an independent investigation on April 20th, 2012.

Samples of a number of bee matrices, including material from planter hoppers and plant samples from neighboring corn fields, were collected. The bee matrix samples were submitted to two different laboratories for analysis of pesticide residues. Bee samples

were also analyzed for viruses and pathogens. This report records Bayer CropScience's investigation and results of these specific incidents.

If you have any questions relating to the enclosed report, please do not hesitate to e-mail me at <u>clive.halder@bayer.com</u>, or phone me at 919-549-2824.

Yours Sincerely,

Clive A. Halder, Ph.D.
